

Zip the panels together to make the barrier as wide as you need.

The panels are marked so that you can easily identify their orientation.

Start at the top – look for “Top Left” – and zip the panels downwards. This will enable you to unzip from the bottom once the barrier is installed, similar to the fly of a tent.

Use the 2.5 foot panel as a doorway. Position it with that in mind when zipping your panels together. This panel comes with Velcro strips. Use them to create hands free access for moving equipment and supplies or for providing easy access to the worksite when needed. Simply unzip both sides, roll the flap up and secure it with the Velcro strips.
